

Slack

This document shows some important statistics about one of the most important platforms and resources our team uses, slack. Slack is a collaboration hub that connects our team, helps us keeping track of our objectives and organizes us, so that everything goes smoothly and without hiccups.

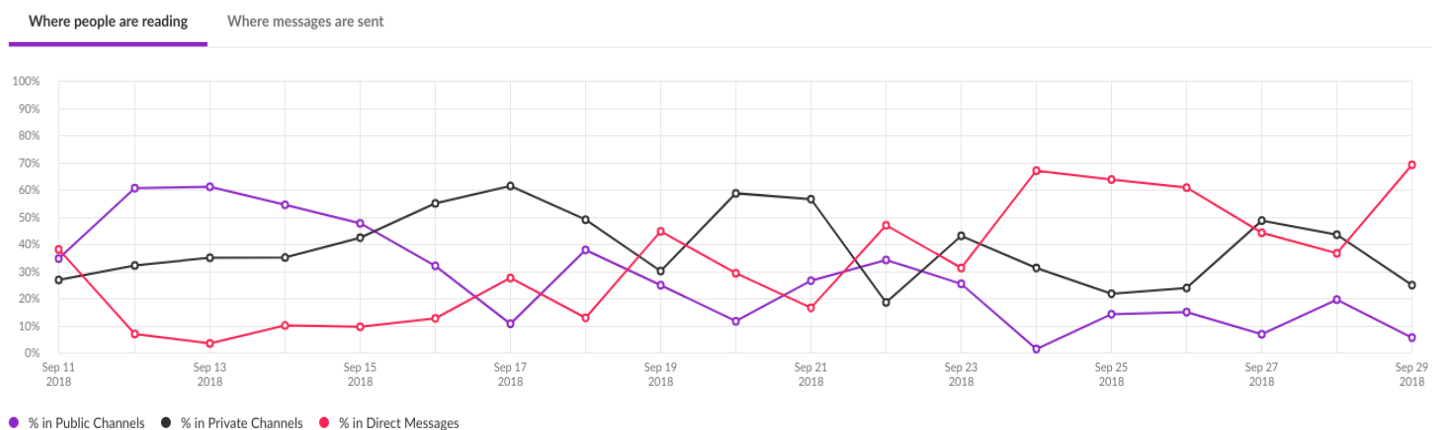

This chart represents the relation between the weekly active users (green line) and weekly users posting messages (blue line).

According to the chart above our team is more communicative than ever with almost 100% of the weekly active users posting messages, a percentage never seen in the previous 3 weeks. Despite the weekly active users decreased marginally (has to be rectified in next sprint), users are actually more active since the number of users posting messages reached a peak.

This graph shows a more in depth approach of what we saw in the first graph. As you can see here, our team is rising in communication as we peaked in daily users posting messages and stabilizing in daily active users with little fluctuation.

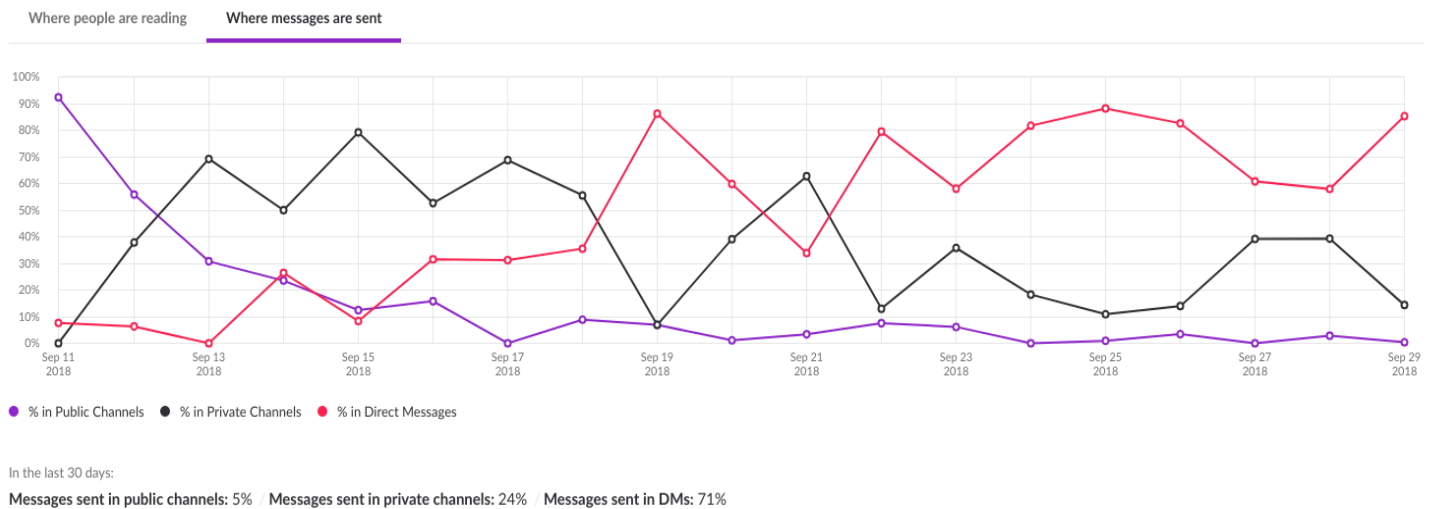

In the last 30 days:

Messages read in public channels: 22% / Messages read in private channels: 34% / Messages read in DMs: 43%

The chart above breaks down where people are reading messages. As the team's workflow stabilizes, there is less need to post messages in public channels but subjects are managed in a more encapsulated way, using private channel and direct messages.

This graph is according to that thought, as we can see people are reading more posts from private channels and direct messages.

With the same principles of the previous graph applied here, team members know to who and where they should ask for help. As problems become more personalized and situational depending on the task in hands, members start to use direct messages and not as much public and private channels. This graphs shows that.

In conclusion, first sprint was the period where people start to know each other and we start to grow as a team. People are more comfortable with slack and the statistics show that. Team members are more active than ever and more productive. Not cluttering public channels with not very important matters, using private channels and private messages instead.
